The information contained within this update is obtained from data provided by Ministries of Health of Member States and National Influenza Centers through reports sent to Pan American Health Organization (PAHO) or updates on their web pages.

Epidemiologic influenza update

In Chile\(^1\), nationally, influenza-like illness (ILI) activity has been increasing since epidemiological week (EW) 32, remaining this week (EW 37) well above the epidemic threshold. At the regional level, the highest rates of ILI activity were in the regions of Los Lagos, Bio Bio, Los Ríos and Maule. The proportion of emergency services consultations for respiratory illness, out of the total number of consultations, has been increasing since EW 32, remaining this week similar to the last week.

In Mexico\(^2\), after a sustained decrease from EW 9 to EW 27, the number of reported acute respiratory infection (ARI)/ILI cases increased from EW 28-35. The highest cumulative incidence in ARI/ILI cases during EW 34-38 were reported mostly in the Southern states. The number of ARI cases has been above the national threshold (75\(^{th}\) percentile) since EW 31. During this period, there have been no reports of excess in the number hospitalizations or deaths associated with influenza or SARI/ILI. From EW 30-35 the primary influenza virus in circulation was influenza A/H3N2, which thus far has been sensitive to oseltamivir and resistant to adamantanes.

In the United States\(^3\) in EW 37, the proportion of outpatient consultations for ILI continued to remain below the national baseline. All the sub-national surveillance regions reported the proportion of ILI to be below their region-specific baselines. The proportion of deaths attributed to pneumonia and influenza was above the epidemic threshold. No influenza -associated pediatric deaths were reported this week.

Viral circulation

The information below is based on reports from National Influenza Centers and influenza laboratories from the Region.
